--	---

Maryville, TN - July 7, 2015 - The advisory in effect for Culton Creek from Old Mount Tabor Road to North Hall Road has been lifted. The results of continuous sampling show that the levels of acrylonitrile are now below levels that would impact aquatic life at all test points. Data sampling

results below are for the first test site (nearest the derailment site, worst case scenario). All other testing points show levels at below these levels.

For additional information regarding concerns about concentration levels, please contact 1-866-812-9565.
